

“Development of mononuclear metal complexes for photocatalytic CO₂ reduction”

Dr. Jieun Jung

Lecturer
Department of Chemistry,
Graduate School of Science,
Nagoya University

Abstract

Photocatalytic reduction of carbon dioxide (CO₂) is recognized as an important research area owing to problems related to the depletion of fossil fuels and environmental problems. Typical examples of CO₂ photo-reduction by transition metal complexes were achieved by a combination of a photosensitizer (PS) and a catalyst (Cat). On the other hand, single-active-site metal complexes acting as both PS and Cat are alternative photocatalysts where photoinduced electron transfer from the PS to the Cat process is dispensable. In my talk, I'll introduce tetradentate PNNP-type metal complexes for the photocatalytic CO₂ reduction and their reaction mechanisms.
